

Seg length Hist

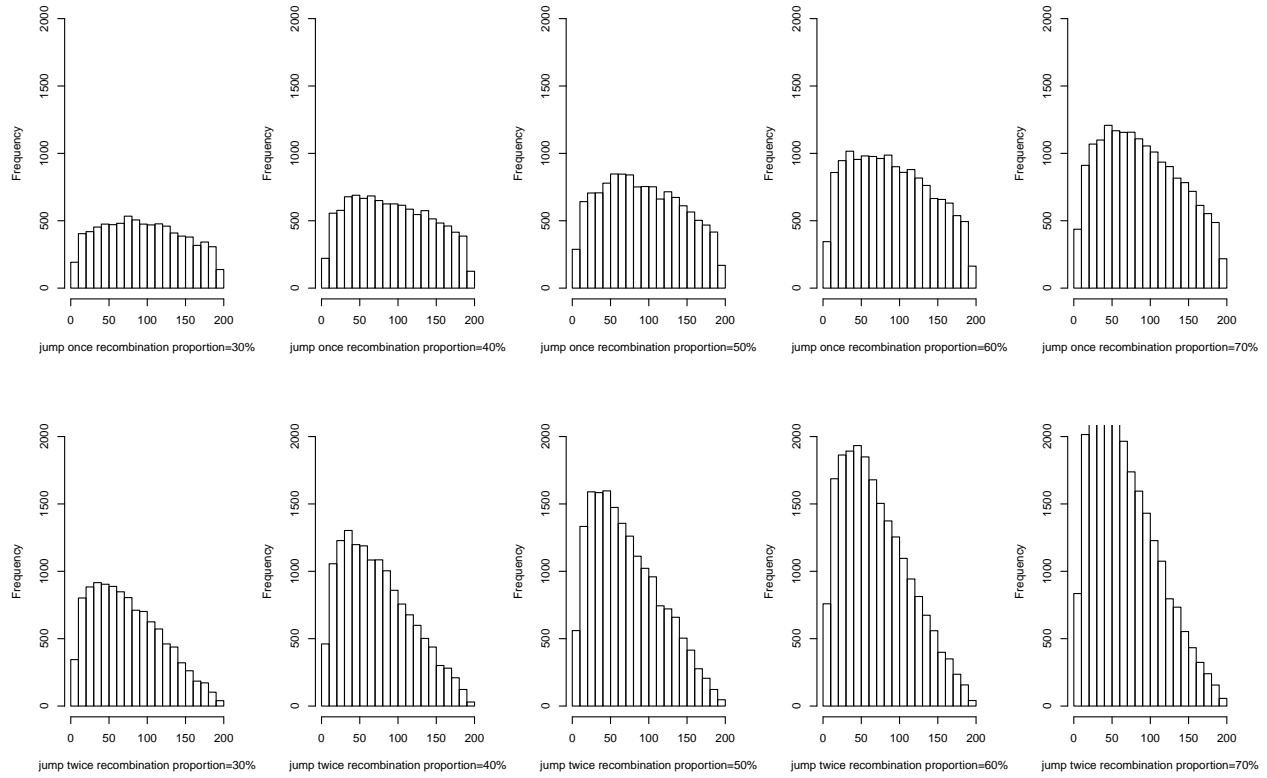

Qian Feng

22/08/2019

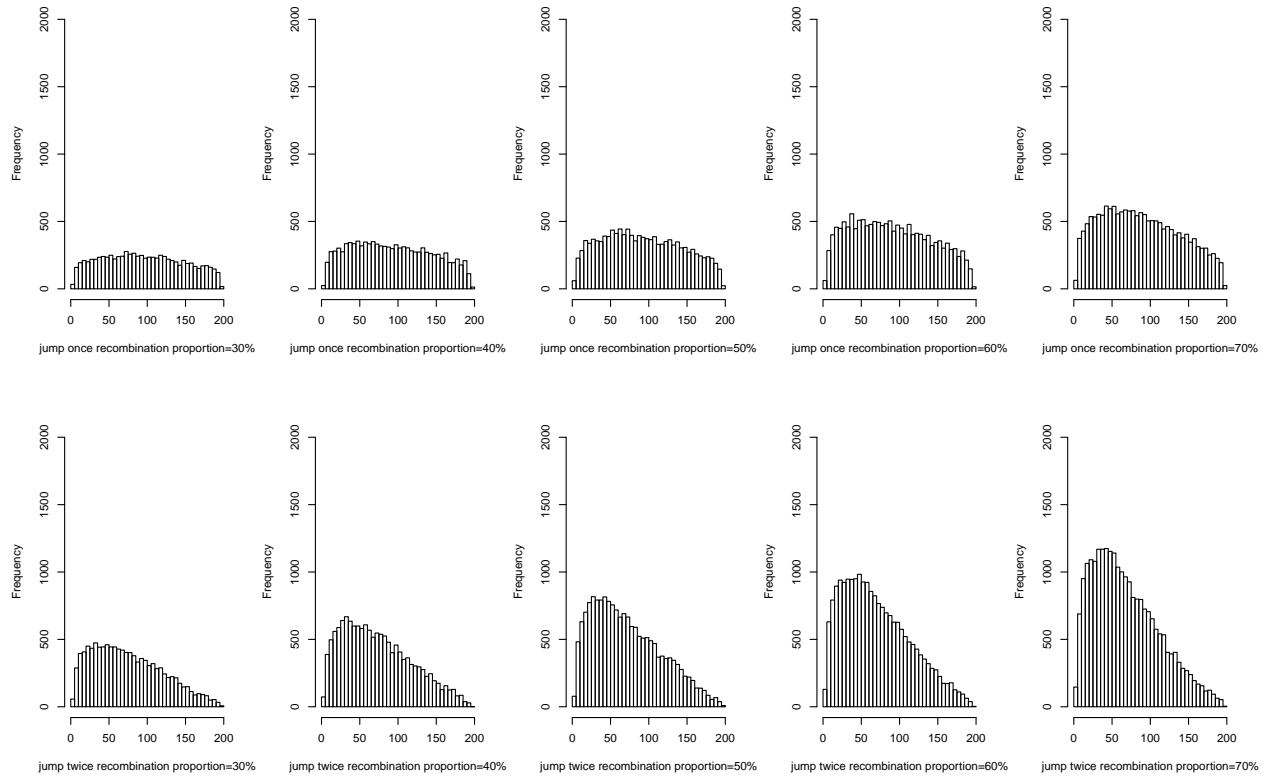

Following plot is the histogram of segment length when recombination proportion increases from 30% to 70% at both jump once and jump twice case.

Since some target sequence is fully aligned to another donor sequence, so we just temporarily ignore the segment length =200 sequences. This leads to the pictures below.

Look at more carefully when we add more bars.

Lastly, this is the segment length distribution from Ghana pilot real data.
